In computer networking, a reliable protocol is a protocol which notifies the sender whether or not the delivery of data to intended recipients was successful. Reliability is a synonym for assurance, which is the term used by the ITU and ATM Forum.. Reliable protocols typically incur more overhead than unreliable protocols, and as a result, function more slowly and with less scalability.

A computer network is a digital telecommunications network which allows nodes to share resources. In computer networks, computing devices exchange data with each other using connections between nodes. These data links are established over cable media such as wires or optic cables, or wireless media such as Wi-Fi.. Any http message (whether it is a request or response) needs to know how to reach its destination. In order to reach its destination, each http message carries an address called the destination TCP

address.. And each TCP address is composed of an IP address and a port number.. I know all these acronyms (TCP, IP, etc..) might be overwhelming if your networking concepts are not strong.
